

ABSTRACT

1 An ambulance stretcher support is described for an ambulance having a floor with
a top floor surface. In one embodiment, each support includes a stretcher leg receiving
member that is adapted to releasably receive an ambulance stretcher leg. A base,
5 configured to be mounted to the ambulance floor, mounts the stretcher leg receiving
member for movement between a position substantially coplanar with the top floor surface,
and a position below the top floor surface. A vibration reduction device is mounted between
the base and the stretcher leg receiving member such that the stretcher leg can be
releasably supported on the stretcher leg receiving member and the vibration reduction
10 device will reduce transfer of vibration from the ambulance floor to the stretcher .
